Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                    5
                                                                                                                                                                                                                                                                                                                                                                                                                   CC entigen of the prostate, ANYSS194). These peptitine transmemorane commonclonal anti-STRAP-I antibodies. STRAP-1 is the prototype commonclonal anti-STRAP family of proteins (AAY58194-Y58197) which commonclonal anti-STRAP family of proteins (AAY58194-Y58197) which commonclonal anti-STRAP family of proteins (AAY58194-Y58197) which commonced in the prototype commonced in the structural conservation, but which show a significant structural homology to known human proteins. The STRAP-1 come significant structural conservation, but which show a common significant structural conservation is a structurally, STRAP-1 is a 339 amino call structurally, STRAP-1 is a thought to be a common significant structurally, STRAP-1 is a 339 amino call structurally structurally structurally structurally, STRAP-1 is a 339 amino call structurally agents, and because they are easily targetted by contains a step structurally structurally agents, and because they are expressed mainly contained side effects on other tissues.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to human six transmembrane epithelial CC antigen of the prostate (STEAP) protein. STEAP is a member of cell CC surface serpentine transmembrane antigens. STEAP gene is used in gene CC therapy. Inhibiting the development or progression of a cancer (eg. CC prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP CC or inhibiting growth or killing cells expressing STEAP in a patient, CC comprises administering a vaccine composition to the patient. Treating CC a patient with a cancer that expresses STEAP, or inhibiting growth or CC killing cells expressing STEAP, comprises administering to the patient a CC vector encoding single chain monoclonal antibody that comprises the CC variable domains of the heavy and light chains of the monoclonal antibody that specifically binds to STEAP, such that the vector delivers the CC that specifically binds to STEAP, such that the vector delivers the CC the encoded single chain monoclonal antibody coding sequence to the cancer cells and CC the encoded single chain monoclonal antibody is expressed CC intracellularly. The present sequence is extracellular loop of STEAP-1 CC suitable for cloning into pFc, which is used in the invention. STEAP-1 CC gene is located on chromosome 7p22.3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

This sequence represents a novel human protein, STRAP-1 (serpentine transmembrane antigen of the proteins (AAY58194-Y58197) which can member of the STRAP family of proteins (AAY58194-Y58197) which carbibit a high degree of structural conservation, but which show no significant structural homology to known human proteins. The STRAP-1 gene has been localised to chromosome 7p22. STRAP-1 is thought to be a CC type IIIa membrane protein and is expressed predominantly in prostate cells in normal human tissues. Structurally, STRAP-1 is a 339 amino acid protein characterised by six transmembrane domains and intracellular N- and C-termini, suggesting that it folds in a "serpentine" manner into three extracellular and two intracellular loops. STRAP-1 mRNA and protein expression is maintained at high levels and throughout all stages of prostate cancer. STRAP-1 mRNA and/or protein is also overexpressed in certain other cancers, including bladder, colon, pancreatic and ovarian cancer. The function of the STRAP proteins is not known. They may be ion channels (from the presence of six transmembrane comming, a feature which is shared by certain ion channels) or gap-junction proteins (from immunohistochemical staining). STRAP-1 and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       88888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC STRAP-2 are cell-surface tumour antigens. Immunisation with a STRAP CC protein induces cellular and humoral immune responses against CC STRAP-expressing cells. STRAP proteins may be used to identify CC specific-binding agents, to produce anticancer vaccines and to generate specific antibodies. The antibodies may be used for detection, prognosis, and monitoring of cancers (or susceptibility to cancer), as therapeutic cinhibitors or to target therapeutic agents to their site of action. STRAP CC nucleic acids may be used for recombinant protein production, as CC diagnostic and prognostic reagents, for identifying STRAP-expressing CC cells for screening inhibitors of STRAP expression and for therapeutic cells for screening inhibitors of STRAP expression and for therapeutic CC modulation/inhibition of STRAP expression. Since high levels of STRAP cproteins are exposed on the cell surface, they are easily targetted by conprostatic epithelial cells, agents targetted to them should have companional side effects on other tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic epitopes derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The present sequence is a prostate specific polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                        Tang
Zhao
The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce
                                                                                                                                                              Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy -
                                                                                                                                                                                                                                              WPI; 2001-476283/51.

                        The present invention describes polynucleotide sequences (I) which encode prostate-specific proteins (II). (II) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (II), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used for monitoring the progression of cancer in a patient. (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating e.tivity, tissue growth factor activity, immunomodulatory activity and activity, inthibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polynucleotide encoding a prostate-specific protein, diagnosing, monitoring and treating prostate cancer in a for use in vaccines -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              04-OCT-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SXS
      The present invention relates to methods of detecting a prostate cancer-associated transcript in a cell from a patient. The method comprises contacting a biological sample from the patient with prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences to them. The prostate cancer associated polynucleotide sequences care differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit prostate cancer. The nucleic acid sequences are particularly useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a protein described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New prostate-specific polynucleotides for diseases, in particular prostate cancer, a progression of cancer -

The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, haematopoiesis regulating activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: Records for SEQ ID NO 2110 (AAK52581), (AAM80020) are omitted as the relevant pages were missing at the time of publication.

STEAP is a member of cell surface serpentine transmembrane antigens. STEAP-1 gene is located on chromosome 7p22.3 and is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting growth or killing cells expressing to the patient. Treating a patient with a cancer that composition to the patient. Treating a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expressing STEAP, comprises administering to the patient a vector encoding single chain monoclonal antibody that comprises the variable domains of the heavy and light chains of the monoclonal antibody that specifically binds to STEAP, such that the vector delivers the single chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain monoclonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antibody is expressed intracellularly. Note: The present sequence is also shown in sequence listing of the specification, but it lacks amino acid residues at its N-terminal e

                                                           by expressing KIM encoding polynucleotides, to promote growth and/or CC survival of damaged tissue (e.g. renal tissue), since the KIM proteins CC are upregulated in injured or regenerating (especially renal) tissues. CC KIM fusion proteins, conjugates, antibodies and vectors can also be used CC therapeutically, e.g. these or the KIM proteins may be included with an acceptable carrier in pharmaceutical compositions, useful for therapy/ CC prophylaxis of conditions associated with disfunction/disregulation of CKIM genes or proteins, especially renal failure, acute nephritis). The CC function in humans (e.g. acute renal failure, acute nephritis). The CC polynucleotides can be used to produce antisense sequences which, when iternalised into cells, can disrupt expression of a cellular KIM gene, CC also useful in therapy (e.g. to block the growth of tumours dependent on CC KIM for growth) or compositions. The proteins and polynucleotides are CC (indicative of increased risk, or presence of, renal injury or impaired CC (useful diagnostically e.g. to detect and quantify renal injury or impaired CC (increased risk, or presence of, an autoimmune response or abnormal CC tissue growth arising from/affecting renal tissue). The proteins can calso be used to locate KIM-producing cells (especially specific loci, ce.g. tissue masses abnormally producing/expressing KIM such as tumours arising from/affecting renal tissue), by contacting cells with an consisting from/affecting renal tissue), by contacting cells with an consisting from/affecting renal tissue).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 17; Page 57-58; 213pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel nucleic acids encoding novel human foetal CC antigens. The nucleic acids and proteins are used to prevent, treat (e.g. CC by gene therapy) or amellorate a medical condition in e.g. humans, mice, crabbits, goats, horses, cats, dogs, chickens or sheep. They CC rabbits, goats, horses, cats, dogs, chickens or sheep. They CC to a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in CC diagnostic immunoassays e.g. radioimmunoassays or enzyme linked CC immunosorbent assays (ELISA). Disorders which are diagnosed or treated cinclude autoimmune diseases e.g. rheumatoid arthritis, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to CC be used to aid wound healing and epithelial cell proliferation, to CC resemblation, for supporting cell culture of primary tissues, to CC resemblation, for supporting cell culture of primary tissues, to crass food additive or preservative to increase or decrease storage considerals, cofactors and other nutritional components. Numerous and disorders referred by the nucleic acids and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CANY2303 represent consensus sequences of various sections of the gp41 CC constrained helical peptides of the invention. The constrained helical peptides of the invention. The constrained helical peptides of the invention. The constrained helical constrained helical peptides of the invention. The constrained helical constrained helical peptides an octapeptide in which both terminal conditions and cyclising the octapeptide by reacting the specified side-chain constrained helical peptides are used to treat or prevent HIV constrained helical peptides are used to treat or prevent HIV constrained helical peptides are used to treat or prevent static constrained helical peptides are used to treat or prevent of the constrained helical peptides are also useful for diagnosing HIV infection. Other constrained helical peptides derived from several different strains of CC uses for the constrained helical peptides are in affinity purification configuration; as epitope mimics for antibody production; for isolation configuration and table, e.g. replacements for protein A in immunoglobulin for isolation configuration antibody clones from phage display libraries, or as stable form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CThe invention relates to cyclic peptides (A) with a constrained helical conformation, derived from gp41 (glycoprotein 41, a viral envelope protein) protein of human immunodeficiency virus (HIV). The cyclic peptides have formulas given in the specification part of which are CC derived from a consensus sequence of gp41 derived from HIV clades A, B, CC C, D, E or O. The peptides are used to cause induction of a specific CC immune response, resulting in antibodies that prevent virus-induced CC membrane fusion. The peptides are used to treat subjects with, or at risk CC of, HIV infection, either as antifusion/anti-infection agents or, CC preferably where associated with a carrier, as an immunogen (including as CC vaccine) to raise antibodies. The antibodies may be used for diagnosis or CC grevention/treatment of HIV infection (i.e. acquired immunodeficiency CC syndrome, AIDS), e.g. prevention of mother-to-child transmission or in CC cases of health care accidents. The peptides can be based on specific HIV CC strains, e.g. breakthrough isolates of HIV that have developed during CC vaccine trials, so a combination of them should cover a wide range of CC protection. The present sequence is gp41 protein from a particular CC HIV clade used for derive a consensus accuments of mail
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

CC (HIV). Specifically, AAY22810-Y22910 are derived from gp41 proteins CC of known HIV virus strains (AAY22810, AAY22871, AAY22880, AAY22888 and CC AAY22903 represent consensus sequences of various sections of the gp41 CC protein). Sequences derived from the peptides are used to produce CC constrained helical peptides of the invention. The constrained helical peptides of the invention. The constrained helical cc amino acids have a side-chain that includes a group able to form an amide cc bond, and cyclising the octapeptide by reacting the specified side-chain cc residues with a diffunctional linker to produce two amide bonds. CC infection, especially as vaccines that generate antibodies that CC constrained helical peptides are used to treat or prevent HIV cc infection, especially as vaccines that generate antibodies that CC constrained helical peptides derived from several different strains of CC constrained helical peptides derived from several different strains of CC uses for the constrained helical peptides are in affinity purification of ligands (particularly where complete binding protein is not readily cc available, e.g. replacements for protein A in immunoglobulin cc forms of "floppy" peptides or protein A in immunoglobulin cc of synthetic antibody clones from phage display libraries, or as stable cc forms of "floppy" peptides or proteins.
Production of constrained helical peptide(s) by linking side chains on termini of octa:peptide - derived from human immunodeficiency virus gp41 protein, useful in vaccines for treatment and prevention of infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptides AAY22805-Y22917 are derived from Human immunodeficiency virus (HIV). Specifically, AAY22810-Y22910 are derived from gp41 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 11; Page 174-175; 279pp; English.

Cooperates with TLR2 and modulates the response to microbial constituents. Acts via MyD88 and TRAF6, leading to NF kappa-B activation, cytokine secretion and the inflammatory response (By similarity).

SUBCELLULAR LOCATION: Type I membrane protein. Plasma membrane because in the control of the
